

SEED ROUND · 2026 · CONFIDENTIAL

FrameGraph

The output layer for the agent era.

AI can read the world. FrameGraph lets it produce the finished result — documents and images that are correct, on-brand, and ready to use.

[Founder name] · [email] · [website]

THE SHIFT

AI learned to read. Now it has to produce.

For two years the race was comprehension — models that read screens, documents, and images. That half is largely solved. The unclaimed half is output: turning what a machine intends into a real, finished, trustworthy artifact a business can actually send.

01 — SOLVED

Read

Machines now understand screens, files, and images. This is the part everyone built.

02 — OPEN

Produce

Machines making finished, correct visual artifacts on their own. Still largely missing.

03 — THE PRIZE

The layer

Whoever builds the infrastructure for that output owns a foundational position.

FrameGraph is building that layer.

THE PROBLEM

A machine-made document today is either fake-looking or quietly broken.

IMAGE GENERATORS

It produces a picture

You can't edit it, the text comes out garbled, the numbers are invented, and you can't trust it for anything that matters.

CODE-IT-YOURSELF AI

It looks right, then breaks

Output that looks right but breaks: text overflows, things overlap, the layout collapses. Plausible — not shippable.

Generating something is easy. Turning it into a finished artifact you can trust enough to ship without a human checking it is the bottleneck — and today that's still a person's job.

THE OBVIOUS OBJECTION

“But AI can already write code and make a UI.”

True. The difference isn't who draws it first — it's what you're left holding. A generated image is a dead-end you can only change by re-prompting. We hand you an open file you own.

YOURS, NOT THE TOOL'S

Open & editable

A structured file a person or an agent can open, change, and extend — change one number or color by hand; don't regenerate the whole thing.

NO LOCK-IN

Walk away with it

For UI it's one framework-free HTML file — the moment a developer has it, they can use it however they like, with or without us.

SHIP UNATTENDED

Checked, every time

Because it's structured, we proofread every output automatically — a machine can produce it at scale without a human checking each one.

The labs' output traps you; ours sets you free. The lock-in isn't the file — it's the flow that produces a perfect one on every change, at volume. A better model just feeds that flow.

THE SOLUTION

FrameGraph turns intent into a finished, checked file.

You — or your AI — describe what you want, or point it at your data. FrameGraph assembles the artifact, checks it the way a meticulous proofreader would, and renders a real file: a slide, a report, a web page, a chart, an image. At any quality, from a quick sketch to print-ready.

Spell-check and a printing press — for everything AI makes that you can see.

HOW IT WORKS

Three steps. No design software. No guesswork.

STEP 1**Describe**

A person or an AI says what's needed — or simply hands over the data.

STEP 2**Build**

FrameGraph lays it out correctly — spacing, alignment, brand, structure — automatically.

STEP 3**Check & render**

It proofreads the result against the rules, then outputs a finished file. Anything wrong is caught before it ships.

The same step that makes it work for one document makes it work for a million.

WHY IT'S DIFFERENT · THE MOAT

Anyone can make a picture. We make a result you can trust.

CHECKED

Every output is automatically proofread for layout and brand. It won't ship broken.

CONSISTENT

Same input, same file, every time — which is what lets it plug into real business systems.

BUILT FOR MACHINES

Designed for AI to operate directly, at scale, without a human babysitting each one.

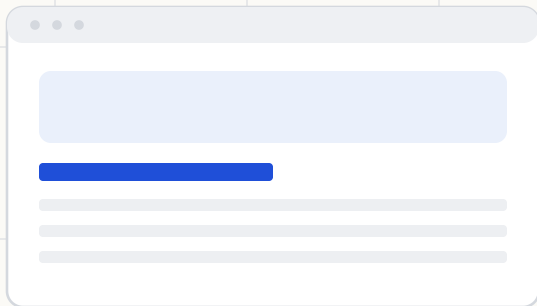

FLEXIBLE

One tool from rough sketch to polished, final asset. No switching between apps.

Image generators: can't edit, can't trust. · Design tools: slow, human-only, one at a time.

PROOF — IT ALREADY WORKS

Not a concept. A working system.

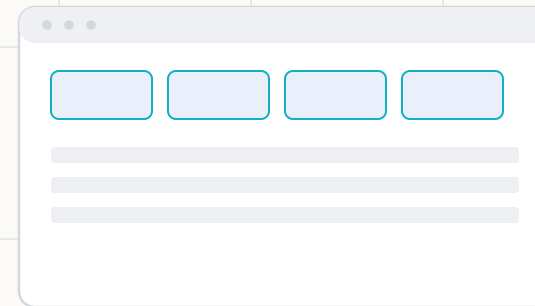

RANGE

Real software screens, full marketing pages, dashboards, and a 30-page designed book — all from the same engine.

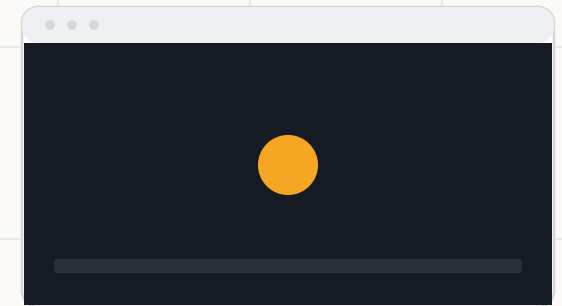

SELF-CHECKING

It proofreads its own output automatically and flags anything off-spec.

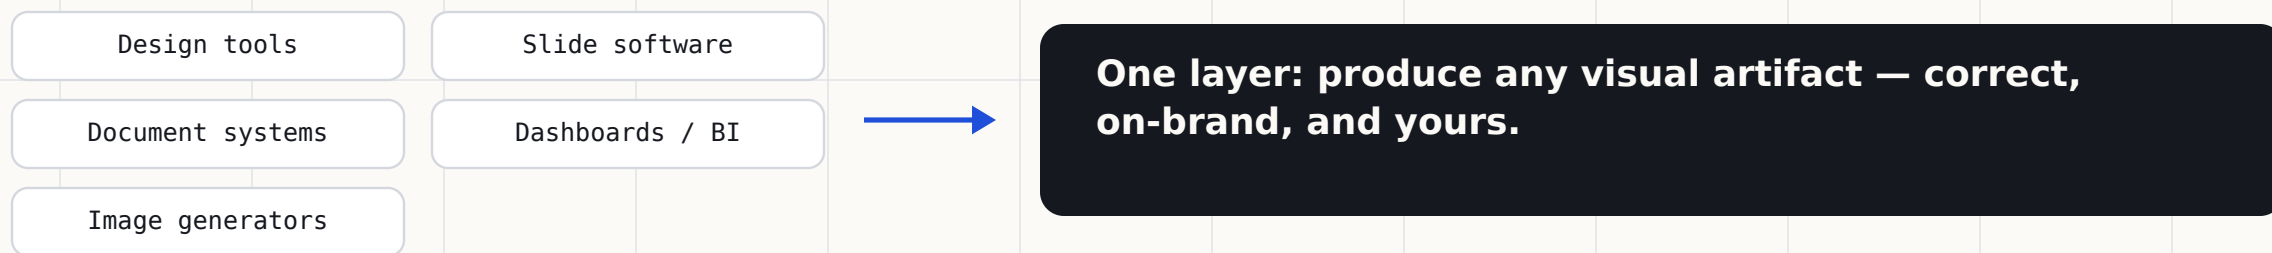

DOGFODED

It even renders its own workspace, end to end.

These stopped being separate markets the moment the maker became a machine.

Design tools, slide software, document systems, dashboards, image generators — each exists because a person operated it. Take the person out and they're one thing: producing a visual artifact. FrameGraph is the layer underneath all of them.

We don't boil that ocean. We start at automated branded documents + a verified-output API — then expand outward.

MARKET • THE SIZE

A tens-of-billions shift, riding the fastest-growing category in software.

TAM • THE CATEGORY

\$50B+ / yr

Producing every business visual artifact — design, presentation & customer-document software — inside a generative-AI market compounding 30–40%+ a year.

SAM • WHAT WE SERVE

~\$12B / yr

The slice that's machine-produced at volume: automated documents, images, dashboards & UI for business, plus verified-output infrastructure for AI products.

SOM • BEACHHEAD

\$50–150M

Reachable now: branded documents & dynamic images at scale, plus a verified-output API for AI builders — on usage-based pricing.

Anchors (2025 analyst estimates): design ~\$10–18B • presentation ~\$9B • customer-document / CCM ~\$2.5B • generative AI ~\$25–70B at +30–40%/yr.

Third-party estimates (Mordor, Grand View, Precedence, Coherent et al., 2025–26), ranges for scale — not a forecast of company revenue.

BUSINESS MODEL

We get paid every time something is produced.

USAGE

Pay per use

A small fee each time a document or image is rendered. Grows automatically with a customer's usage.

TEAMS

Team plans

Subscriptions for companies that produce regularly and want seats and shared brand rules.

ENTERPRISE

Enterprise

Brand & compliance controls plus private deployment for large customers — the high-value tier.

Software margins. Revenue that scales with our customers' success — not our headcount.

THE ASK

Raising \$2.0M to turn a working system into a paid product.

BUILD THE TEAM

A small, senior engineering and go-to-market team.

SHIP THE FIRST PAID PRODUCT

And land our first paying customers.

EARN THE NEXT ROUND

Hit the milestones that make a Series A the obvious next step.

~18–24 months of runway · standard post-money SAFE

TEAM

Why us.

FOUNDER

[Your name]

One line: the most relevant thing you've built or shipped — and why it makes you the right person to build this.

UNFAIR ADVANTAGE

[Why you, why now]

The insight, head start, or access you have that others don't — e.g., a working system already producing this range.

FIRST HIRES

[Who you'll add]

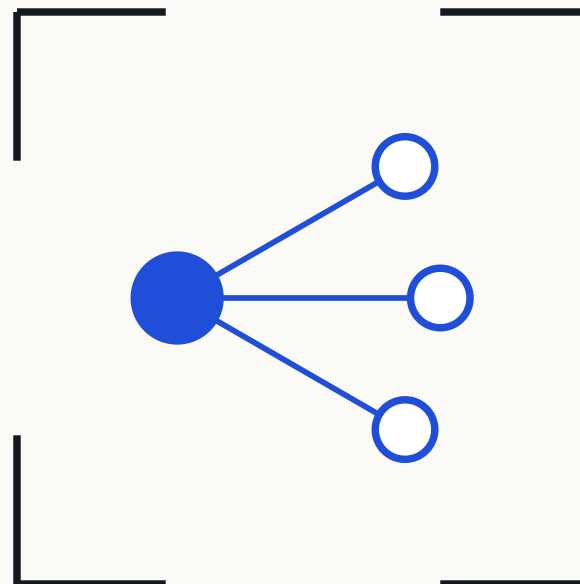

The 2–3 roles this round funds, and any advisors or early believers already on board.

Note for you, not the investor: at seed, this is the slide they weigh most. Make it concrete and specific.

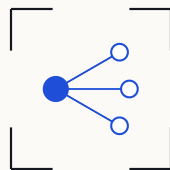

Soon, every page a business shows the world will be produced and checked by a machine.

FrameGraph is the layer that makes that output real, correct, and yours.
